

## Two Factor Authentication

Two Factor Authentication (TFA; 2FA) is a security process in which two methods of authentication are used to verify who you are.

For example, one method currently utilized within Infor is your network username and password. By introducing another method of authentication, such as a PIN code created within an app on your mobile phone, both your network password and the PIN would be used together to authenticate you. In short, two-factor authentication keeps logins secure by preventing access to Infor through password guessing or brute force dictionary attacks.

The TFA vendor chosen by Infor is Duo Security.

## Duo Security Overview

Most two factor solutions implement secondary authentication by a single method, providing a unique code (either via a soft or hard token). The employee is required to enter this code each time at login. To make this process easier, Duo Security utilizes “Duo Push”.

Authenticating with Duo Push is as easy as tapping a button on your phone. No phone calls to wait for or passcodes to type in.

Duo Push is the easiest form of secondary authentication. Once Duo Mobile is installed and activated on your phone, you can authenticate with just one tap of a button.
